

Modified Pigmentation for FX 920

The FX 920 pigment content was slightly re-adjusted for the benefit of improved lamination values. The pigments themselves, the colour coordinates, and the visual impression remain unchanged. Therefore, this improvement will be implemented immediately.

Colour deviation

Compared to the previous formula, the deviation of the dE-value is approximately 1.09 at full colour, and is thus within the existing tolerance. Visually, there's no difference. The formulations of special colours will be adjusted if necessary in order to comply with the tolerances.

For further information on Mara® Flex FX please refer to www.marabu-inks.com

Date of Change-Over

This change becomes effective starting with batch 803 (immediately). You will find an additional remark on the label stating:

„Attention: Modified Pigmentation“
